

# EVALITA 2011 Experiments with a Constraintbased Dependency Parser 

M. Grella, M. Nicola, D. Christen

parsit<br>http://www.parsit.it

## Outline

- Parsit at Evalita 2011
- Evaluation and results
- Description of the System
- Example
- How we came to a Constraint-based Parser
- Future Works
- Scientific Research plays a central role in Parsit activities
- Parsit technologies will be available for free for partners with researching purposes
- We focus on syntactic parsing of natural language
- The parser architecture used at Evalita 2011 is one of a series of experiments we have been dedicating to in the past few months
- The parser was tested against the Evalita 2009 dataset and the results encouraged us to participate to Evalita 2011

## RESULTS

## Results

Arc Accuracy ( 300 sentences for a total of 7401 tokens)

|  | LAS | UAS | LAS2 |
| :---: | :---: | :---: | :---: |
| Parsit (M. Grella) | $\mathbf{9 1 . 2 3 \%}$ | $\mathbf{9 6 . 1 6 \%}$ | $\mathbf{9 3 . 8 7 \%}$ |
| \#2 | $89.88 \%$ | $93.73 \%$ | $93.39 \%$ |
| \#3 | $88.62 \%$ | $92.85 \%$ | $92.50 \%$ |
| \#4 | $85.34 \%$ | $91.47 \%$ | $89.57 \%$ |

The paper submitted includes some consideration on the difference between the LAS and UAS values

Correct Sentence Accuracy

| CSA-L | CSA-U |
| :---: | :---: |
| $22.33 \%$ | $57.00 \%$ |

Average LAS and UAS per sentence

| AVG-L | AVG-U |
| :---: | :---: |
| $91.66 \%$ | $96.63 \%$ |

## Results

Average Accuracy relative to sentence length

| Group | Range | No. of sentences | Portion of dataset |
| :---: | :---: | :---: | :---: |
| 1 | $1-10$ | 15 | $5.00 \%$ |
| 2 | $11-20$ | 95 | $31.67 \%$ |
| 3 | $21-30$ | 108 | $36.00 \%$ |
| 4 | $31-40$ | 62 | $20.67 \%$ |
| 5 | $41-50$ | 20 | $6.67 \%$ |

We considered meaningful groups 2,3 only

Results

Recall and Precision of every syntactic relation label attachment

# DESCRIPTION OF THE SYSTEM 

## System - Goals

- Coherence (consistency) of the syntactic trees typical of top-down parsers
- High level of accuracy for label assignment
- Robustness typical of bottom-up parsers
- Capable of handling non-projectivity
- Morphological analysis without pre POS-tagger

Efficiency has not been considered to be relevant in this specific context.

## System - Approach

## Experiments with a Constraint-based Dependency Parser

View of the parsing process as a finite configurations problem that can be formulated as a constraint satisfaction problem (CSP)

Dependency parsing problem is reduced to the problem of finding a dependency graph for a sentence that satisfies all the constraints defined by the grammar
cf. Maruyama, Harper and Helzerman, Menzel, Schröder, Duchier, Debusmann

## System - Constraint Solver

The Constraint Solver has been implemented in Ada 2005 using Gecode constraint programming library which provides constraint-solving algorithms with state-of-the-art performances.

For a sentence of length $n$, there are finitely many possible trees involving just $n$ nodes. Out of this large number, we must select those that are grammatical.

Dependency Graph is represented using an Adjacency Matrix.

The constraints propagation technique is applied to restrict possible analyses.

## System - Format

TUT Format
ART $\rightarrow$ NOUN
PREP $\rightarrow$ NOUN
CONJ-SUBORD $\rightarrow$ VERB

## Parsit Format

ART $\leftarrow$ NOUN
PREP $\leftarrow$ NOUN
CONJ-SUBORD $\leftarrow$ VERB

## System - Constraints

The Italian grammar has been expressed for the first time as a set of constraints
Wide coverage lexicon of subcategorization for nouns, adjectives, verbs and adverbs: each lexical entry contains information on category, agreement and valency (i. e. what types of complements are required by the word).

The grammar has been then fine-tuned on the TUT Treebank thanks to our automatic tools written in Python.
(deprel DET
(governor NOUN)
(dependent ART)
(< (dependent ID) (governor ID))
(morpho-agree dependent governor))
(deprel SUBJ
(governor VERB)
(dependent SUBJ)
(complex-morpho-agree dependent governor))

## System - Search

- The Matrix is now consistent but, with the exception of simple cases, still shows ambiguous dependencies
- Simple search algorithm: spawns sequentially all possible non-ambiguous combinations of dependencies from the Matrix
- All incoherent parse trees are rejected (e.g. in the dependency graph each node has only one incoming edge, there are no cycles and there is precisely one root)

## System - Disambiguation

The score of each ambiguous relation in a given solution is computed by counting the number of occurrences of that relation in the Italian version of Wikipedia previously analyzed by TULE parser [Leonardo Lesmo]

Parsed sentences have been enriched with Parsit Intra-Paragraph Anaphora Resolution (IPAR) and indexed by our Natural Language Indexer (NLI)

NLI is a component of the high performance Natural Language Retrieval Architecture (NLRA) designed and developed by Parsit which allows for complex queries on parse trees data through a particular pattern matching technique

Our indexed version of the Italian Wikipedia can be explored at:
http://www.parsit.it/evalita2011

## Chi ha inventato il telefono?

```
{"multidep" :
    [
    {"L":"inventare"},
        {"L" : "telefono", "D": "OBJ"},
        {"D": "SUBJ"}
    ]
}
```

## EXAMPLE

il gatto insegue il topo in giardino
the cat chases the mouse in the garden

## Example - Propagation

|  | ROOT | il | gatto | insegue | il | topo | in | giardino |

HOW WE CAME TO A CONSTRAINTBASED PARSER?

## Experiments with a Hybrid Transition-based Dependency Parser

- Multi-threaded Multilayer Perceptron (OpenMP has been used)
- Oracle Parsit Strategy
- Online disambiguation (POS tagging during Syntactic Parsing)
- Multilayer Linguistic Supervision (Surface, Morphology, Syntax)

```
    "Cade [la neve]"
"Mi piace [la prugna]"
```

```
S \leftarrow []
I \leftarrow [w1 , w2 , ..., wn]
A}\leftarrow[
while I != [] do
        X \leftarrow get_context(S, I, A)
        Y \leftarrow estimate_synactions(X, model)
```

        foreach \(y\) in \(Y\) do
        if is_permissible(y, S, I)
            if check_linguistic_supervision(y, S, I, A, rules)
                transition(y, S, I, A)
                break
    

## FUTURE WORKS

- Accuracy improvements
- Performance improvements
- Hybrid statistical transition-based and constraint-based

## Future works

## THANKS
