

EVALITA 2011

Evaluation of NLP and Speech Tools for Italian

EVALITA 2011

Speech Tasks

Francesco Cutugno & Mauro Falcone

Outline

- Introduction
- The tasks:
 - **Automatic Speech Recognition**
(Large Vocabulary Transcription)
 - **Forced Alignment**
(on Spontaneous Speech)
 - **Student Contest**
(on Best Voice Application on Mobile Platform)
- Participants and results
- Conclusion and future activities

Introduction

- **EVALITA-S** is only at its second run ...
(we are still young – there is a long way to reach a “mature” position)
- **None** of the tasks of the previous campaign have been repeated in 2011 evaluation
(this means that a lot of new work must be done every time ...)
- **Application oriented** “tasks” are now of growing relevance in Evalita-S
(now, we need to involve non only “academic”... and we want/would like to involve mainly research companies in the near future!)

Although of early experience, in Evalita-S we never forget the “**scientific rigour**” and the importance of “**emerging technologies**” when defining new tasks and activities.

Student Contest

(Best Voice Application on Mobile Platform)

to create a (first) link between
Students/Young-Researchers and
the industrial world in the field of
Speech Technology

A meritocratic reward on the basis of
task competition has been adopted, in
order to guarantee a large
participation. But . . .

Student Contest

(Best Voice Application on Mobile Platform)

We partially reached the goal...

Starting from 11 registered participants, only 3 completed the task, and these 3 are all from the same University

Participants (overall by task)

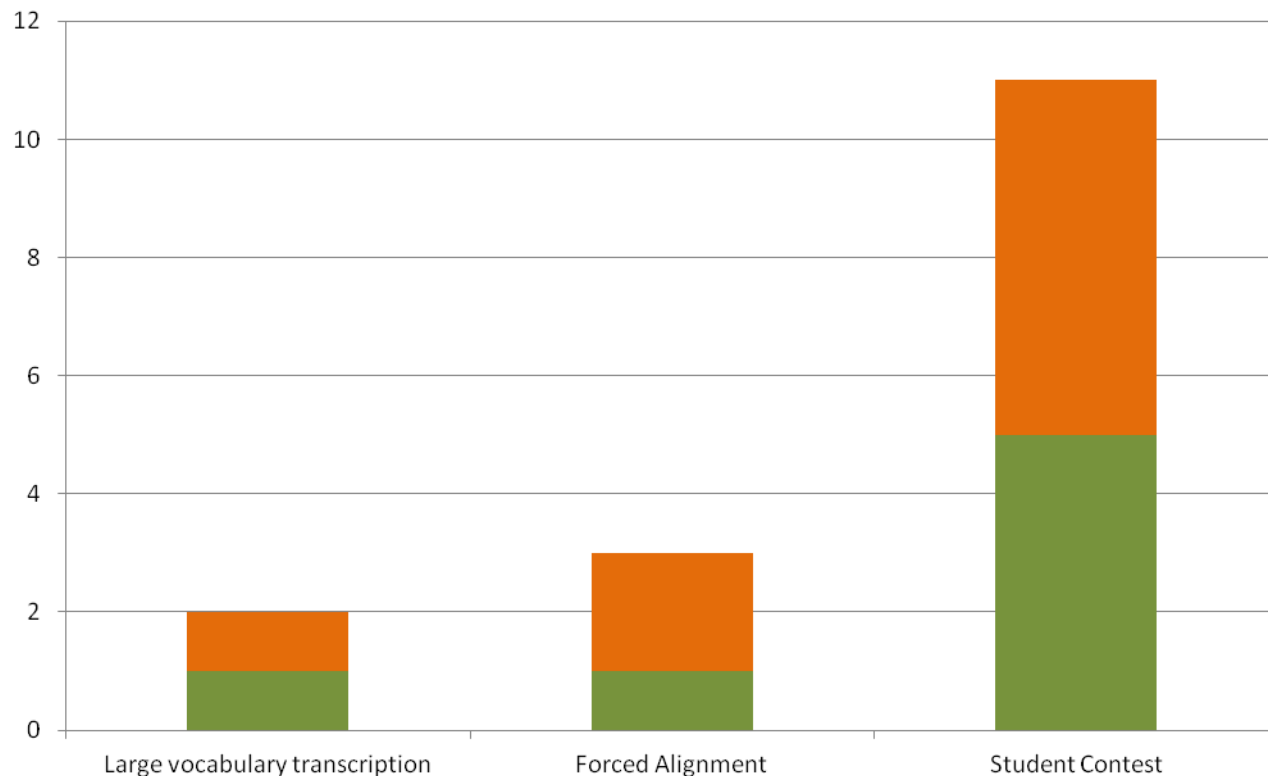

The total number of **Participants** is **16** (2+3+11)

but ...

Participants (organizers vs all)

looking at the Institutions...

the **Organizer** also acts as **Participants**, in all the tasks.

And more precisely ...

Participants

we a total of 9
different
Institutions...

In addition for the SC
task 10/11 of potential*
Participants are from the
same city... so that:

**WE
NEED/ASK FOR
A LARGER
PARTICIPATION**

** only 3 of the 11 registered have
completed the task: 9 retired before
the deadline*

Some conclusion (a learned lesson)

Participants must/should have the same “**weight class**”, especially when we are facing industrial structures . . .

(but also Academics must be “comparable” with other partners both industrial as well as academics)

In both Evalita-S (2009 & 2011) we found that

industrial partners

scare of “**lower results**”, so they prefer to miss this opportunity and avoid any risks . . . This strongly reduced the number of participant, and

shows a very important problem

Some conclusions

Thinking at **Evalita-S 2013**, we **now** have to take the appropriate actions to avoid a possible “**stranding**” of this worthy initiative on speech technologies.

Our “**lifetime**” could be:

- focus on(ly) speech “killer application”
(the ones “companies” can’t say NO !)
- find tasks that “sound” more international
(try to relax the “Italian” dependency of the task)
- find task that require “low cost” resources
(e.g. crowdsourcing, unlabeled speech materials, etc.)

and last, but not least:

to have a “political” support/sponsor at Academic and Industrial level

It is important to . . .

- 
- promote the evaluation “philosophy” as a mandatory activity for the innovation, the growth and the competitive success of our country in Europe and in the world

- to increase the Speech Technology Italian Community (STIC), and to create/support fixed and stable collaborations among all partners; especially between Research & Innovation (or Academic and Industry)
